Sequence 48, Application US/09534185
Patent No. 6403767
GENERAL INFORMATION:
APPLICANT: Graham, Gerard J. et al.
APPLICANT: Graham, Gerard J. et al.
TITLE OF INVENTION: No. 640376761 Molecules of the G Protein-Coupled
TITLE OF INVENTION: Heptahelical Receptor Superfamily and Uses
Score 39; DB 3; Length 374;
Pred. No. 61;
1; Mismatches 3; Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       NUMBER OF SEQUENCES: 56

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 3900

US-10-029-386-32911

US-10-029-386-32911

Sequence 32911, Application US/10029386

Publication No. US20030194704A1

GENERAL INFORMATION:

GENERAL INFORMATION:

APPLICANT: Penn, Sharron G.

APPLICANT: Rank, David R.

TITLE OF INVENTION: HUMAN GENOME-DERIVED SINGLE EXON NUCLEIC ACID PROBES USEFUL FOR CYPTEN TOF INVENTION: EXPRESSION ANALYSIS TWO

FILE REFERENCE: AEOMICA-X-2

CURRENT APPLICATION NUMBER: US/10/029,386

CURRENT APPLICATION NUMBER: 2001-12-20

NUMBER OF SEQ ID NOS: 34288

SOFTWARE: Annomax Sequence Listing Engine vers. 1.1

LENGTH: 406

Sequence 33093, Application US/09270767

GARERAL INFORMATION:

APPLICANT: Homburger et al.

TITLE OF INVENTION: Nucleic acids and proteins of Drosophila melanogaster:

FILE REFERENCE: File Reference: 7356-094

CURRENT FILING DATE: 1999-03-17

NUMBER OF SEQ ID NOS: 62517

SEQ ID NO 33093

LENGTH: 155
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 RESULT 2

                      Sequence 53, Application US/09324542

Patent No. 6328978

GENERAL INFORMATION:
APPLICANT: Watson, James D.
APPLICANT: Tan, Paul L.J.
APPLICANT: Prestidge, Ross
TITLE OF INVENTION: Methods and Compounds for the Treatment
TITLE OF INVENTION: Methods and Compounds for the Treatment
TITLE OF INVENTION: Methods and Compounds for the Treatment
TITLE OF INVENTION: Methods and Compounds for the Treatment
TITLE OF INVENTION: Methods and Compounds for the Treatment
TITLE OF INVENTION: Methods and Compounds for the Treatment
TITLE OF INVENTION: Methods and Compounds for UNRERY APPLICATION NUMBER: US/09/324,542

CURRENY FILING DATE: 1999-06-02
EARLIER APPLICATION NUMBER: US 08/997,080
EARLIER FILING DATE: 1997-12-23
NUMBER OF SEQ ID NOS: 194
SOFTHARE: FastSEQ for Windows Version 3.0
SEQ ID NO 53

                                                                                                                                                                                                                                                                                                                                                                   C; Accession: S57500 F. Molff, N.; Morrical, M.D.; Walter, P.; Strub, K. Subi, N.; Boria, P.; Wolff, N.; Morrical, M.D.; Walter, P.; Strub, K. submitted to the EMBL Data Library, March 1994
A; Description: The 9kD subunit of the murine signal recognition particle.
A; Reference number: S57500
A; Accession: S57500
A; Status: preliminary
A; Molecule type: mRNA
A; Residues: 1-86 < BUI>

REPLINE K., Walter P.;
RT dimerization of the Alu domain of the signal recognition particle (SRP):
dimerization of the two protein components is required for efficient
RT dimerization of the two protein components is required for efficient
RT dimerization of the two protein components is required for efficient
RT dimerization of the two protein components is required for efficient
RT dimerization of the RNA.";
LI FUNCTION: Signal-recognition-particle assembly has a crucial role
cof SRP together with SRP14 and the Alu portion of the SRP
RNA, constitutes the elongation arrest domain of SRP. The complex
COF SRPP and SRP14 is required for SRP RNA binding.
COF SUBGNIT: Signal recognition particle consists of a 7S RNA molecule
of 300 nucleotides and six protein subunits: SRP72, SRP68, SRP54,
COF SUBCELLULAR LOCATION: Cytoplasmic.
COF SIMILARITY: Belongs to the SRP9 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This SWISS-PROT entry is copyright. Characterization of human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              In targeting secretory proteins to the rough endoplasmic reticulum membrane. SRP9 together with SRP14 and the Alu portion of the SRP RNA, constitutes the elongation arrest domain of SRP. The complex of SRP9 and SRP14 is required for SRP RNA binding.

-I-SUBUNT: Signal recognition particle consists of a 7. SNA molecule of 300 nucleotides and six protein subunits: SRP72, SRP68, SRP54, SRP19, SRP14 and SRP9.
-I-SUBCELLULAR LOCATION: Cytoplasmic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            X-RAY CRYSTALLOGRAPHY (2.53 ANGSTROMS) IN COMPLEX WITH SRP14.

X-RAY CRYSTALLOGRAPHY (2.53 ANGSTROMS) IN COMPLEX WITH SRP14.

IN MEDLINE-97377014; PubMed=9233785;

Birse D.E., Kapp U., Strub K., Cusack S., Aaberg A.;

Dinding heterodiner, SRP9/14.";

EMBO J. 16.3757-3766(1997).

IL FUNCTION: Signal-recognition-particle assembly has a crucial role in targeting secretory proteins to the rough endoplasmic reticulum membrane. SRP9 together with SRP4 and the Alu portion of the SRP RNA, constitutues the elongation arrest domain of SRP. The complex of SRP9 and SRP4 is required for SRP RNA binding.

C.: SUBUNIT: Signal recognition particle consists of a 7S RNA molecule of 300 nucleotides and six protein subunits: SRP72, SRP68, SRP54, SRP19, SRP14 and SRP9.

C.: SUBCELLULAR LOCATION: Cytoplasmic.
Miyazaki A., Sakai K., Sasaki D., Shibata K., Shinagawa A., Yasunishi A., Yoshino M., Waterston R., Lander E.S., Rogers J., Birney E., Hayashizaki Y.; "Analysis of the mouse transcriptome based on functional annotation of 60,770 full-length cDNAs."; Nature 420:563-573 (2002).

This SWISS-PROT entry is copyright. It is produced through a collaboration between the Swiss Institute of Bioinformatics and the FNEL cutstation the European Bioinformatics Institute. There are no restrictions on its use by non-profit institutions as long as its content is in no way modified and this statement is not removed. Usage by and for commercial entities requires a license agreement (See http://www.isb-sib.ch/announce/or send an email to license@isb-sib.ch).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       -!- SUBDNIT: Interacts with the CDK2 and the CDC2 protein kinases to form a serine/threonine kinase holoenzyme complex. The cyclin subunit imparts substrate specificity to the complex. Does not bind CDK4 and CDK5 (in virro). The cyclin Al-CDK2 complex interacts with transcription factor E2F-1 and RB proteins.
-!- TISSUE SPECIFICITY: Very high levels in testis and very low levels in DEVELOPMENTAL STAGE: Expression increases in early G1 phase and reaches highest levels during the S and G2/M phases.
-!- SIMILARITY: Belongs to the cyclin family. Cyclin AB subfamily.
                                                                                                                                                                                                                                                                                                                                                                 TISSUB=Myeloid;
